

*Excellence in Electronics***TYPE**
CK5703WB

The CK5703WB is a heater-cathode type medium-mu triode of subminiature construction capable of operation as an oscillator, Class C Amplifier, or frequency multiplier in the UHF region. This type is characterized by long life and stable performance. It is designed for service where conditions of high temperature and mechanical shock or vibration are encountered. The flexible terminal leads may be soldered or welded directly to the terminals of circuit components without the use of sockets. Standard inline subminiature sockets may be used by cutting the leads to a suitable length.

MECHANICAL DATAENVELOPE: T-3 Glass

BASE: None (0.016" tinned flexible leads, Length: 1.5" min.
Spacing: 0.048" center-to-center
except leads 1-3=0.096" center-to-center)

TERMINAL CONNECTIONS: (Red Dot is adjacent to lead 1)

Maximum Impact Acceleration (Shock Test—Note 3) 450 G
Maximum Uniform Acceleration (centrifuge Test—Note 4) 1000 G
Maximum Vibrational Acceleration (96 Hour Fatigue Test—Note 5) 2.5 G
Maximum Bulb Temperature 220 °C

MOUNTING POSITION: Any**ELECTRICAL DATA**

CAUTION—To Electronic Equipment Design Engineers: Special attention should be given to the temperature at which the tubes are to be operated. Reliability will be seriously impaired if maximum bulb temperature is exceeded. The life expectancy may be reduced if conditions other than those specified for life test are imposed on the tube and will be reduced appreciably if maximum ratings are exceeded. Both reliability and performance will be jeopardized if filament voltage ratings are exceeded. Life and reliability of performance are closely related to the degree that regulation of the heater voltage is maintained at its center rated value.

RATINGS AND NORMAL OPERATION:	MIL-E-1 SYMBOL	DESIGN MINIMUM	NORMAL TEST CONDITIONS (Note 7)	NORMAL OPERATION (Note 6)	DESIGN MAXIMUM	MIL-E-1 UNITS

NOTES

- Note 1: Characteristics, Quality Control Test Procedures, and Inspection Levels are made according to the appropriate paragraphs of MIL-E-1 "Inspection Instructions for Electron Tubes," and MIL-STD-105A.
- Note 2: Without shield.
- Note 3: Test conditions and acceptance criteria per Shock Test procedures of MIL-E-1 basic specifications.
- Note 4: Centrifuge Test with forces applied in any direction.
- Note 5: Test conditions and acceptance criteria per Fatigue Test procedures of MIL-E-1 basic specifications.
- Note 6: These normal values represent conditions at which control of reliability may be expected.
- Note 7: These normal test conditions are used for all characteristic tests unless otherwise stated under the individual test item.
- Note 8: For most applications the performance will not be adversely affected by $\pm 10\%$ heater voltage variation, but when the application can provide a closer control of heater voltage, an improvement in reliability will be realized.
- Note 9: Change of transconductance for individual tubes from that value measured at $E_f = 6.3$ V to that value measured at $E_f = 5.5$ V.
- Note 10: In addition to meeting the tightened electrical, physical, and mechanical tests described in this data sheet, these Raytheon Reliable tubes are now guaranteed to be free from "Potential" defects identifiable by microscopic inspection as described by appendix B of "Inspection Instructions for Electron Tubes".
- Note 11: Operation time is the time in seconds required for the plate current to attain a value within plus or minus 10 percent of the three minute plate current (1) value. No preheating before this test will be allowed.

RECEIVING AND CATHODE RAY TUBE OPERATIONS

RELIABLE SUBMINIATURE TRIODE

ELECTRICAL DATA (cont'd)

NOTES (cont'd)

Note 12: The tubes shall be rigidly mounted on a table vibrating with simple harmonic motion. The tubes shall be vibrated for a total of 6 hours, 2 hours in each of three positions, X1, X2, Y1. Only rated heater voltage shall be applied. Tubes which show one or more of the following defects shall be considered failures:

- (a) Tubes which show permanent or tap shorts or open circuits following fatigue test, when tested as specified in paragraph 4.7.2 and 4.7.3 of Specification MIL-E-1.
- (b) Tubes which do not comply with post fatigue limits. This is a destructive test.

Note 13: The provisions of paragraph 4.9.20.5 of Specification MIL-E-1 shall apply, except for test conditions listed for shock test (2).
